

**ASTRONERGY**

## **Environmental policy**

| Photovoltaic technology is an environmentally friendly way of producing electrical energy. We combine the manufacture of these green products with an environmentally conscious approach to our work.

| Our commitment to protect the environment is based on personal conviction, and we do so by applying precautionary measures to prevent environmental problems arising in the first place.

| Active environmental protection is part of our corporate culture and will continue to be so in the future. We protect the environment in a way that is sustainable, systematic and for the long term.

| We know that our business operations have an impact on environmental assets that are worth protecting. This is why we use the best environmentally friendly technologies and processes available, where we can.

| All of our activities are built on efforts to continually improve our environmental performance, conserve natural resources, and comply with the relevant environmental regulations.

| We reinforce these efforts by formulating, communicating and monitoring clearly defined environmental targets and programmes.

| By systematically identifying all the requirements placed on us – including laws and ordinances as well as the specific requirements of our various stakeholders – we ensure that we work within the law.

| Internally, we promote environmental protection through our integrated management system (IMS).

| Our goal is to manufacture our products to the highest quality. We believe that environmental protection is an integral part of quality. Our corporate culture can only endure if we have properly trained staff.

| We therefore regularly run training and informational events that encourage our staff to actively and independently protect the environment as they work.

| We firmly believe that assessing our activities in terms of possible environmental impact and making continuous improvement is only fully possible in cooperation with our staff and external stakeholders.

| An internal company suggestion scheme has a permanent place in our communications structures.

| We also share our convictions with our external suppliers and business partners. We incorporate them into considerations of our environmental performance and regularly evaluate them from an environmental perspective.

| We communicate our environmental policy to all our staff, for instance in training sessions, through the company newspaper, and via the quality management, environmental management, energy, and occupational health and safety documentation system that is available on the intranet.

| We communicate our environmental policy externally to all interested social groups via our website and other channels.
